Hitachi Unified Compute Platform for the SAP HANA Platform on VMware vSphere in a Medium 1 TB Scale-Up Configuration using Hitachi Compute Blade 500 and Hitachi Unified Storage VM

Reference Architecture Guide

Hitachi Unified Compute Platform for the SAP HANA Platform on VMware vSphere in a scale-up medium 1 TB configuration is a pre-configured analytical virtual appliance ready to plug into a network to provide real-time access to operational data for use in analytic models.

This reference architecture guide for the medium size 1 TB configuration describes how to deploy Hitachi Unified Compute Platform for the SAP HANA Platform on VMware vSphere in a scale-up configuration using the following:

- Hitachi Compute Blade 500 (with 520X B1 server blades)
- Hitachi Unified Storage VM
- SAP HANA

This technical paper assumes familiarity with the following:

- SAN-based storage systems
- General storage concepts
- SAP HANA
- VMware vSphere 5.5 update 1
- Common IT storage practices
Solution Overview

The 1 TB medium size UCP for SAP HANA on VMware vSphere in a scale-up configuration reference solution is a blade server solution for SAP HANA on VMware. This reference architecture uses the following:

- **Hitachi Compute Blade 500** — An enterprise-class server platform.
  - This solution uses two 520X B1 server blades.

- **Hitachi Unified Storage VM** — Storage virtualization system designed to manage storage assets more efficiently. The persistent storage of the HANA server resides on this storage device.

- **SAP HANA** — A multi-purpose, in-memory database to analyze transactional and analytical data.

- **VMware vSphere** — A cloud computing virtualization operating system platform

Figure 1 shows the topology of this reference architecture.

Figure 1
Key Solution Elements

These are the key hardware and software components used in this reference architecture.

Hardware Elements

Table 1 describes the hardware used to deploy the medium 1 TB UCP for SAP HANA on VMware in a scale-up configuration.

**Hitachi Compute Blade 500**

*Hitachi Compute Blade 500* combines the high-end features with the high compute density and adaptable architecture you need to lower costs and protect investment. Safely mix a wide variety of application workloads on a highly reliable, scalable, and flexible platform. Add server management and system monitoring at no cost with Hitachi Compute Systems Manager, which can seamlessly integrate with Hitachi Command Suite in IT environments using Hitachi storage.

This configuration uses two 520X B1 server blades in the Hitachi Compute Blade 500 chassis.

Table 2 has the specifications for the 520X B1 server blades used in this solution.

</table>
Symmetric Multiprocessing Connector
Use Symmetric Multiprocessing (SMP) technology to combine multiple server blade resources into a single server. SMP connectors combine server blade resources, subject to product limitations.

The 520X B1 server blade uses symmetric multiprocessing in one of two ways:

- Combines the resources of two server blades with a 2-blade SMP connector
- Combines the resources of four server blades with a 4-blade SMP connector

This solution uses a 2-blade SMP connection interface to connect two server blades. This combination acts as a single HANA VM server node for the medium size configuration with the following:

- 4 CPUs
- 60 cores
- 1024 GB of RAM

Hitachi Unified Storage VM
Hitachi Unified Storage VM is an entry-level enterprise storage platform. It combines storage virtualization services with unified block, file, and object data management. This versatile, scalable platform offers a storage virtualization system to provide central storage services to existing storage assets.

Unified management delivers end-to-end central storage management of all virtualized internal and external storage on Unified Storage VM. A unique, hardware-accelerated, object-based file system supports intelligent file tiering and migration, as well as virtual NAS functionality, without compromising performance or scalability.

The benefits of Unified Storage VM are the following:

- Enables the move to a new storage platform with less effort and cost when compared to the industry average
- Increases performance and lowers operating cost with automated data placement
- Supports scalable management for growing and complex storage environment while using fewer resources
- Achieves better power efficiency and with more storage capacity for more sustainable data centers
- Lowers operational risk and data loss exposure with data resilience solutions
- Consolidates management with end-to-end virtualization to prevent virtual server sprawl
The operating system LUNs, data LUNs, and log LUNs reside on this storage device.

This solution uses a single Hitachi Unified Storage VM.

Software Elements

SAP HANA

SAP HANA is a flexible, multipurpose in-memory database. It combines SAP software components optimized to specific hardware. These components come from leading hardware partners of SAP, including Hitachi. The use of the SAP HANA appliance does not depend on the data source.

The SAP HANA appliance enables the analysis of huge volumes of detailed business information in real-time from almost any data source. It captures operational data in memory as it occurs. Flexible views quickly expose analytic information. External data can be added to analytic models from across an entire organization.

This hardware and software combination integrates a number of SAP components, including the following:

- **SAP In-Memory Database**
  
  This hybrid in-memory database combines row-based, column-based, and object-based database technology. It takes advantage of parallel processing capabilities of multi-core CPU architectures.

- **SAP LT (Landscape Transformation)**
  
  This replicates source system data to the SAP HANA appliance.

SAP customers can download more information on the SAP HANA Platform at the SAP Service Marketplace. See the installation and upgrade guides download section for SAP In-Memory Computing (SAP In-Memory Appliance — SAP HANA). The following are available:

- **SAP HANA Master Guide**
  
  This is the central starting point for the technical implementation of the SAP HANA platform. Use this for basic concepts and for planning the SAP HANA application system landscape.
- **SAP HANA Installation and Initial Configuration Guides**
  Use the various installation guides to install the required SAP In-Memory Database and the other software components for the different replication technologies. Refer to the SAP HANA Server Installation Guide for an overview on how to install SAP HANA.

- **SAP HANA Technical Operations Manual**
  Provides an end-to-end picture of the available administration tools with SAP HANA appliance and the key tasks for a system administrator to perform.

- **SAP HANA Master Update Guide**
  This explains how to update SAP HANA and its components.

- **SAP Integration and Certification Center (SAP ICC)**
  This page provides information about SAP certified HANA appliances by SAP hardware partners.

The following is a link to all SAP-related documentation: [SAP HANA Platform](#)

The following is a link to all SAP and VMware related documentation: [SAP on VMware](#)

**SUSE Linux Enterprise Server (SLES) for SAP Applications**

The medium size 1 TB UCP for SAP HANA VM runs on a 64-bit SUSE Linux Enterprise Server (SLES) for SAP Applications 11 SP3. The kernel version is 3.0.101-0.35 or later.

The initially delivered configuration of the guest operating system should persist. Changing the configuration settings can cause significant performance problems to occur.

Do not make any modifications to the operating system, except as noted or approved by SAP and Hitachi/HDS. Before updating operating system components, especially the Linux kernel and standard libraries like glibc, please consult the relevant information provided by SAP in the respective SAP notes. Make sure the SAP notes are SAP HANA related and not generally for SAP systems. [SAP note 1944799](#) is a good starting point for this information.

For more details, see section 2.1.4.1, “Updating and Patching the Operating System,” in the SAP HANA Technical Operations Manual.
VMware vSphere 5.5

VMware vSphere 5.5 is a virtualization platform that provides a datacenter infrastructure. It features vSphere Distributed Resource Scheduler (DRS), high availability, and fault tolerance.

VMware vSphere 5.5 has the following components:

- **ESXi**
  A hypervisor that loads directly on a physical server. It partitions one physical machine into many virtual machines that share hardware resources.

- **vCenter Server**
  Management of the vSphere environment through a single user interface. With vCenter, there are features available such as vMotion, Storage vMotion, Storage Distributed Resource Scheduler, High Availability, and Fault Tolerance.

- **VMware vSphere 5.5**
  Enterprise virtualization solution to create a dynamic and flexible data center with integrated management and reporting capability for a high level of server and service uptime.

The Unified Compute Platform for the SAP HANA platform on VMware vSphere solution combines the benefits of the Hitachi UCP SAP HANA appliance with the flexibility and manageability of the VMware vSphere solution.

VMware vSphere customers can download more information about the ESXi Platform on [VMware vSphere Documentation](#). See the vSphere installation and setup guide in the ESXi and vCenter Server Product Documentation section for ESXi documentation. In addition, you can download [Performance Best Practices for VMware vSphere 5.5](#) (PDF).

---

**Note** — This solution assumes that a management server already exists in the customer landscape and is available for use with this solution. Make sure that the landscape has a VMware vCenter infrastructure set up and available.
Solution Design

The detailed design for this Hitachi Unified Compute Platform for the SAP HANA Platform in a scale-up medium 1 TB configuration reference solution includes the following:

- “Hitachi Compute Blade 500 Chassis Configuration,” starting on page 10
- “520X B1 Server Blade Architecture,” starting on page 11
- “Fibre Channel SAN Architecture,” starting on page 11
- “Network Architecture,” starting on page 13
- “Storage Architecture,” starting on page 15
- “VMware vSphere ESXi Configuration,” starting on page 17
- “SAP HANA Configuration,” starting on page 18
Hitachi Compute Blade 500 Chassis Configuration

Figure 2 shows the front and back view of the Hitachi Compute Blade 500 chassis.

In this solution, we use one Hitachi Compute Blade 500 chassis and it consists of a total of two 520X B1 server blades. There are four switch modules on the Hitachi Compute Blade 500 chassis, and they have the following components:

- Switch Module 0 and 1 have 10 Gb/sec Ethernet LAN pass through modules.
- Switch Module 2 and 3 have 8 Gb/sec Brocade Fibre Channel switch modules.
520X B1 Server Blade Architecture

The SAP HANA node is a two-server blade connected using the 2-blade SMP interface connector. This creates a single four-socket SMP node with 60 cores and 1 TB of memory.

Table 4 lists the server blade configuration.

### Table 4. Server Blade Configuration

<table>
<thead>
<tr>
<th>Server Blades</th>
<th>Total 2 server blades</th>
</tr>
</thead>
<tbody>
<tr>
<td>Blade 4 (non-primary)</td>
<td></td>
</tr>
<tr>
<td>Blade 6 (primary)</td>
<td></td>
</tr>
</tbody>
</table>

<table>
<thead>
<tr>
<th>Total Number of CPU Cores</th>
<th>60</th>
</tr>
</thead>
<tbody>
<tr>
<td>Total Memory (TB)</td>
<td>1</td>
</tr>
</tbody>
</table>

**Note** — Due to SAP and VMware requirements for the production 1 TB virtual machine, the actual virtual machine is only allocated with 980 GB of RAM. ESXi processes use the remaining memory. For TDI, quality assurance, and development uses with SAP HANA on VMware, see “Multiple Virtual Machine Configurations” on page 19.

Fibre Channel SAN Architecture

The Fibre Channel SAN architecture consists of the following components on 520X B1 blades:

- **Blade 4 has 1 × 2-port Hitachi FIVE-EX Fibre Channel mezzanine card on mezzanine slot 2**
- **Blade 6 has 1 × 2-port Hitachi FIVE-EX Fibre Channel mezzanine card on mezzanine slot 2**

The mezzanine card installed in mezzanine slot 2 of server blade 4 and server blade 6 connects to the 8 Gb/sec Brocade Fibre Channel switch modules installed in switch slot 2 and slot 3 through the backplane within the Hitachi Compute Blade 500 server chassis.
With the HANA scale-up medium-sized 1 TB configuration, there are four dedicated Fibre Channel ports on the Hitachi Unified Storage VM for Fibre Channel connection with the SAP HANA node. Table 5 shows the storage port mapping.

**Table 5. Storage Port Mapping**

<table>
<thead>
<tr>
<th>Switch Module, Port</th>
<th>Hitachi Unified Storage VM Ports</th>
</tr>
</thead>
<tbody>
<tr>
<td>Switch module 2, Port 0</td>
<td>1A</td>
</tr>
<tr>
<td>Switch module 2, Port 1</td>
<td>2A</td>
</tr>
<tr>
<td>Switch module 3, Port 0</td>
<td>3A</td>
</tr>
<tr>
<td>Switch module 3, Port 1</td>
<td>4A</td>
</tr>
</tbody>
</table>

This configuration supports high availability by providing multiple paths from the host within Hitachi Compute Blade 500 to multiple ports on Hitachi Unified Storage VM.

Figure 1 on page 2 shows the direct connect Fibre Channel architecture. Set the port properties for the point-to-point connection between Hitachi Compute Blade 500 and Hitachi Unified Storage VM as shown in Table 6.

**Table 6. Port Properties**

<table>
<thead>
<tr>
<th>Property</th>
<th>Value</th>
</tr>
</thead>
<tbody>
<tr>
<td>Port Attribute</td>
<td>Target</td>
</tr>
<tr>

</tr>
<tr>
<td>4A-G00</td>
<td>Chassis 1, Server Blade 4, Mezzanine 2, Port 1 WWN</td>
</tr>
</tbody>
</table>
Network Architecture

Use two 10 Gb/sec LAN pass-through modules on switch slot 0 and 1 of the Hitachi Compute Blade 500 chassis. The 520X B1 server blades 4 and 6, each have one 4-port 10 GbE onboard LOM. LOM pass through connectors installed on 520X B1 server blades connect the onboard LAN to the 10 GbE LAN pass-through switch modules installed in switch slot 0 and 1.

The HANA scale-up Medium 1 TB configuration has a total of eight 10 GbE LOM ports. Make the following network connections for the management and uplink network setup of the HANA node:

- Connect port 8 of the LAN pass through module on switch slot 0 and port 12 of the LAN pass through module on switch slot 1 to the external switch.
- The corresponding two ports vmnic1 and vmnic2 appear at the ESXi level and are configured as uplinks in the virtual distributed switch using active-backup mode. These two ports act as the management network for the ESXi node as well as the network for the guest operating system.
- Switch slot 0 LAN pass-through module ports 10, 12, and 14, and also switch slot 1 LAN pass-through module ports 8, 10, and 14 are free for the appliance to connect to the 10 GbE external switches for use as uplink network or vMotion ports.

The compute network setup uses the ports on the 10 GbE LAN pass-through modules, as listed in Table 8.

Table 8. Network Setup Using 10 GbE LAN Pass-through Modules

</tbody>
</table>
The Hitachi Compute Blade 500 chassis has two management modules for redundancy. Each module supports the following:

- An independent management LAN interface from the data network for remote and secure management of the chassis and all server blades
- A serial command line interface and a web interface
- Hot swappable replacements
- Live firmware updates without the need for shutting down the server blades

Figure 3 shows the standard network configuration used for Hitachi Compute Blade 500 chassis.
Storage Architecture

Many factors drive the sizing and configuring of storage for use with the medium 1 TB configuration of Hitachi Unified Compute Platform for the SAP HANA Platform on VMware vSphere in a scale-up configuration reference solution. This includes I/O and capacity requirements.

Note — The storage layout presented uses five parity groups configured as RAID-6 (6D+2P). It supports eight virtual machines running batch loads in parallel. If you want to run eight more virtual machines at the same time for a total of 16 virtual machines of 64 GB running SAP HANA (seen as 61 GB), then Hitachi Data Systems recommends that you purchase four more parity groups for data LUNs and log LUNs. If performance is not an issue or requirement, one set of parity groups has enough storage capacity to host up to 16 virtual machines of 64 GB running SAP HANA.

Figure 4 shows the disk configuration of the storage subsystem.
RAID and LUN Configuration

This reference architecture for Hitachi Unified Compute Platform for the SAP HANA Platform on VMware vSphere in a scale-up medium 1 TB configuration uses the following RAID configuration on Hitachi Unified Storage VM:

- Five RAID-6 (6D+2P) groups created using 32 × 600 GB SAS 10k RPM drives
- One 600 GB SAS 10k RPM spare drive

This reference solution contains the following:

- One 20 GB boot LUN to host the ESXi 5.5 U1 hypervisor.
- One 1.8 TB boot LUN to host the SAP HANA virtual machine server operating system and virtual machine storage
- One 1.2 TB LUN to host the SAP HANA shared volume
- Four 300 GB LUN to host the SAP HANA log volume
- Three 3 TB LUN to host the SAP HANA data volume

Table 9 has the parity groups and LDEV assignments for the medium 1 TB configuration.

<table>
<thead>

</tbody>
</table>
Follow the LUN path assignment in Table 9 for the four host groups on the Hitachi Unified Storage VM in Table 7 on page 12. To support high availability, each LUN has four paths from the host within Hitachi Compute Blade 500 to multiple ports (1A, 2A, 3A, 4A) on Hitachi Unified Storage VM.

### VMware vSphere ESXi Configuration

This section describes the VMware vSphere ESXi configuration.

### SAN Operating System Boot Configuration

This two blade configuration requires SAN boot. It uses one 20 GB LUN from Hitachi Unified Storage VM as the operating system boot volume to host the hypervisor of the medium size 1 TB SAP HANA VM appliance.

The Hitachi FIVE-EX Fibre Channel mezzanine ports in Table 7 on page 12 have the 20 GB ESXi boot LUN configured as the primary boot device. The installation of ESXi version 5.5 update 1 is on the boot LUN.
Activate Round Robin Multipathing Policy
This reference architecture uses the round robin multipathing policy, a component of the ESXi operating system.

Using the round robin multipathing policy allows the configuration of multiple I/O paths between the server blades and Hitachi Unified Storage VM. Round robin aggregates all physical I/O paths into a single logical path and thus provides high availability and load balancing for the block devices. The LUNs are always available unless all four paths fail.

The round robin multipathing policy is used for the following I/O paths:

- SAP HANA server boot LUN
- SAP HANA data volume LUN
- SAP HANA log volume LUN
- SAP HANA shared volume LUN

SAP HANA Configuration
This describes the SAP HANA configuration the medium size 1 TB SAP HANA VM appliance.

SAN Operating System Boot Configuration
This SAP HANA virtual machine configuration requires SAN boot. It uses 100 GB of the SLES_OS_Storage LUN on Hitachi Unified Storage VM for the operating system boot volume for. It is presented to ESXi, created as a 100 GB VMDK using SLES_OS_Storage LUN, and is presented as a VMFS to the 1 TB SAP HANA virtual machine.

The installation of SUSE Linux for SAP Applications version 11 SP3 is on this 100 GB VMDK, including the /usr/sap/ directory for SAP application related files.

SAP HANA Volume Configuration
This SAP HANA virtual machine configuration uses the following:

- Three 3 TB SAP HANA data LUNs on Hitachi Unified Storage VM to create three 3 TB VMDKs for SAP HANA data.
- Four 300 GB SAP HANA log LUNs on Hitachi Unified Storage VM to create four 300 GB VMDKs for SAP HANA log.
- One 1.2 TB SAP HANA shared LUN on Hitachi Unified Storage VM to create one 1.2 TB VMDK for SAP HANA shared.
The logical volume manager (LVM) configures the SAP HANA persistent storage volumes from virtual machines.

- With three VMDKs for the SAP HANA data, the LVM creates a single 3-way striped volume on which the XFS file system is created to store the SAP HANA data volume.
- With four VMDKs for the SAP HANA log, the LVM creates a single 4-way striped volume on which the XFS file system is created to store the SAP HANA log volume.

With one VMDK for SAP HANA shared, create an XFS file system for SAP HANA shared to store SAP HANA binaries, configuration, and trace files.

**SAP HANA Software Installation**

After configuring the file system for the SAP HANA data volume and log volume, the latest version of SAP HANA 1.0 SPS09 is installed on the SAP HANA virtual machine server.

The following SAP HANA software components are installed on the HANA VM server node:

- SAP HANA Database
- SAP HANA Client
- SAP Host Agent
- LM Structure

**Multiple Virtual Machine Configurations**

For non-production environments used for development and quality assurance, these are the size configurations of multiple virtual machines for a 1 TB solution using SAP HANA in a VMware environment.

---

**Note** — Multiple virtual machines are only applicable for non-production environments. The production environment only has one SAP HANA virtual machine.

---

SAP and VMware require the production 1 TB virtual machine only use 980 GB of RAM. ESXi processes use the remaining memory. To allocate memory evenly to all virtual machines and keep within the 980 GB of RAM limitation for the production virtual machine, use the following sizes
to be able to have the maximum number of virtual machines for SAP HANA:

- 1024 GB virtual machine uses 980 GB RAM
- 768 GB virtual machine uses 735 GB RAM
- 512 GB virtual machine uses 490 GB RAM
- 256 GB virtual machine uses 245 GB RAM
- 192 GB virtual machine uses 183 GB RAM
- 128 GB virtual machine uses 122 GB RAM
- 64 GB virtual machine uses 61 GB RAM

While you are free to allocate memory up to its listed size, you will not be able to fit as many virtual machines for SAP HANA.

Table 10 is a sample table for the virtual machines for SAP HANA to fit within the 980 GB limitation. You can have up to 15 virtual machines of 64 GB in your environment, even though this is not shown in the table.

If you want to create more than eight virtual machines, Hitachi Data Systems recommends that you use four more parity groups configured as RAID-6 (6D+2P) to host data LUNs and log LUNs. If performance is not an issue or requirement, one parity group set has enough storage capacity to host up to 16 virtual machines running SAP HANA with 64 GB (seen as 61GB due to the memory limit).
For More Information

Hitachi Data Systems Global Services offers experienced storage consultants, proven methodologies and a comprehensive services portfolio to assist you in implementing Hitachi products and solutions in your environment. For more information, see the Hitachi Data Systems Global Services website.

Live and recorded product demonstrations are available for many Hitachi products. To schedule a live demonstration, contact a sales representative. To view a recorded demonstration, see the Hitachi Data Systems Corporate Resources website. Click the Product Demos tab for a list of available recorded demonstrations.

Hitachi Data Systems Academy provides best-in-class training on Hitachi products, technology, solutions and certifications. Hitachi Data Systems Academy delivers on-demand web-based training (WBT), classroom-based instructor-led training (ILT) and virtual instructor-led training (vILT) courses. For more information, see the Hitachi Data Systems Services Education website.

For more information about Hitachi products and services, contact your sales representative or channel partner or visit the Hitachi Data Systems website.
