

Is your organization ready for VMware converged systems?

It's hard to keep up with the constantly changing business demands of enterprise IT. Are you always in catch-up mode, forced to make small incremental fixes that don't solve weaknesses in the fundamental infrastructure?

Here's how converged infrastructure systems solve your top IT challenges.

! Infrastructure is constraining, rather than supporting, business growth.

How to solve it:

Consolidate

Consolidate your IT environment. This simplifies administration, optimizes virtual server environments, increases capacity utilization and reduces environmental costs.

! You have complicated virtualized and non-virtualized environments.

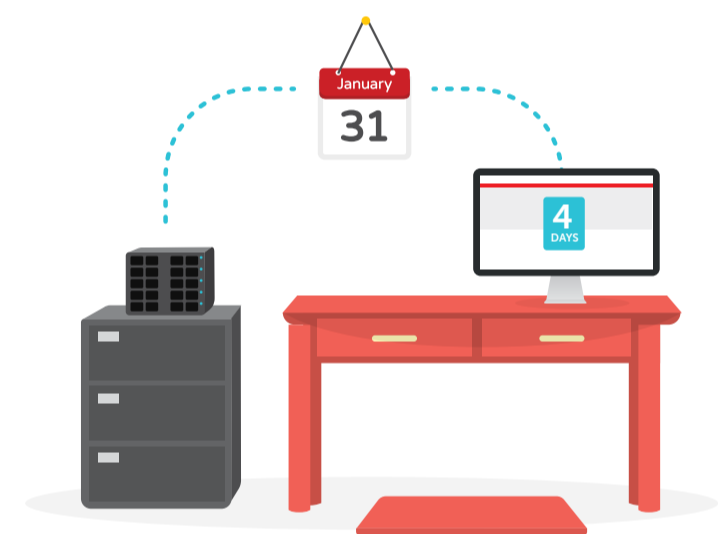

How to solve it:

Virtualize

Converged infrastructures help you virtualize up to 90% of your environments. This improves IT services, efficiency and flexibility and reduces service delivery costs.

! Your business is experiencing delays in rolling out new products and services.

How to solve it:

Automate

Extensive automation results in fewer manual, time-consuming and error-prone activities for your IT department – and improves efficiency. You get more tasks done, faster, and with fewer resources.

! Users are becoming impatient, purchasing their own IT resources outside the business.

How to solve it:

Pay Per Use

Pay per use is an ideal way to simplify how users get and pay for the resources they need from within the company. With pay per use, business units can easily pay for the resources they consume. This approach allows you to scale IT resources according to business demands, and better predict costs. No more Shadow IT.

\$14.3 billion

...the total worldwide spending on converged infrastructure predicted in 2017.¹

Are you ready for the ideal VMware converged infrastructure platform?

Carefully selected systems reduce management and operational complexity, meet service-level requirements for availability, and rapidly provision new services.
